

# NUCLEAR MEDICINE RENOGRAM

## Patient Information

### What is a Renogram?

A renogram looks at the function of your kidneys.

### Preparation

There is no specific preparation and you may eat and drink normally before your appointment. Keep yourself hydrated for the 24h before the scan.

For children under 16yrs of age: Before the appointment time the child should be cannulated at the children assessment unit.

### Pregnancy/Breastfeeding

If you are pregnant or breastfeeding it is essential that you let us know before your appointment date. If you are a female of child bearing age (12-55 years old). You will be asked about your pregnancy and breastfeeding status. If you are unable to confirm you are not pregnant a pregnancy test may be performed.

### Chaperones

All patients are entitled to have a chaperone present for any consultation, examination or procedure where they feel one is required. This chaperone may be a family member or friend. On occasions you may prefer a formal chaperone to be present (ie. trained member of staff).

### The examination

Upon your arrival a radiographer will explain the procedure to you and will ask you a few questions about your health records. You will then have a cannula inserted into a vein in your arm and be positioned on the scan table. Once in position you will have a small amount of radioactive tracer injected through the cannula. This is carried through the bloodstream to your kidneys and then excreted into the bladder. It emits gamma rays which will be detected by a piece of equipment called a gamma camera. This is a very quiet machine and you do not go through a tube or tunnel.

You do not need to undress for the examination, but you may need to remove metal objects from your clothing or pockets, such as coins, jewellery and/or belts as these will interfere with the quality of the pictures.

Halfway through the procedure you may receive an injection of a diuretic through the cannula. This will depend on your clinical indication. This encourages the kidneys to excrete the tracer more rapidly, and helps our doctors to have more information about your kidneys.

At the end of the scan, depending on your clinical indications, you might be asked to empty your bladder (or change the nappy if not potty trained) whilst sitting on a bed pan. Pictures will be taken while you do this to check if any urine is refluxing from the bladder back to kidneys. Your privacy is maintained during the scan. If you are concerned please discuss your concerns with the radiographer.

### **How long will it take?**

The examination takes approximately 30-40 minutes.

### **Who will be present?**

Your scan will be performed by a Nuclear Medicine trained member of staff which stays with you in the room while scanning. In addition we might have students in our department, and they will observe the procedure if you give your permission.

### **Can I bring a friend or relative with me?**

You can bring a friend or relative with you and they may accompany you for the injection or scan. Because our waiting room is very small, we would prefer that you do not bring more than one person with you. It is advisable NOT to have a pregnant woman or any children with you. This is to avoid exposing them to unnecessary radiation.

### **Will the injection hurt?**

The injection is very similar to having blood taken. It will not make you drowsy or prevent you from driving a car.

### **Is radioactivity dangerous?**

The amount of radiation involved is similar to that from an x-ray examination. The radioactivity naturally disperses from the body and is largely gone in 24 hours. The very low risk involved is balanced against the benefit of the information the examination provides for your doctors.

## After the examination

You will be asked to drink more than usual for the rest of the day to help clear the substance from your body. Otherwise you can continue as normal.

## How do I obtain my results?

The results will be sent to the doctor who asked for the examination, and will normally be with them within two working weeks, but if you have an appointment sooner than this, please let us know, and we will ensure the results are available for then.

## How to find us

The Nuclear Medicine department is in the main X-ray department at East Surrey Hospital. This is on the ground floor of the hospital, closest to the main entrance. You can also reach the department by following the main corridor from the east entrance.

**Please report to the main reception.**

## Further Information

If you need to cancel, change your appointment or have any concerns/queries about your examination, please contact the Nuclear Medicine department on: 01737 768511 x6001 (Monday to Friday, 9am – 5pm).

Directions, parking and travel information for East Surrey Hospital and Crawley Hospital is available on our website at [www.surreyandsussex.nhs.uk/finding-us/](http://www.surreyandsussex.nhs.uk/finding-us/)

## Gamma Camera Appeal Fund

A gamma camera appeal fund was set up by Mr and Mrs Bell in 1987 in memory of their son David, and it has been supported by local people ever since. Initially the funds were used to purchase our first gamma camera, and since then it has been used to purchase new and updated equipment; it has also been used for continuing professional education so that staff are able to provide an even better level of service to their patients.

If you would like to contribute to the appeal fund, please send a cheque made payable to Surrey and Sussex Healthcare NHS Trust (Gamma Camera). Thank you.
